Motivation

- COVID-19 Vaccination rate gradually increased, but vaccine hesitancy occurs at the same time.
- Previous vaccine hesitancy Studies have focused on individual characteristics
- Social media can be appropriate source for identifying the public’s perceptions and attitude toward COVID-19 vaccine

Objectives

- Discern the threshold of COVID-19 vaccination hesitancy.
- Examine discourse around COVID-19 vaccination hesitancy

Method

Retrieving

- Query term “Vaccine” for June 2020- June 2021
- Only including “COVID” in Questions
- 3,592 Questions, 66,820 Answers

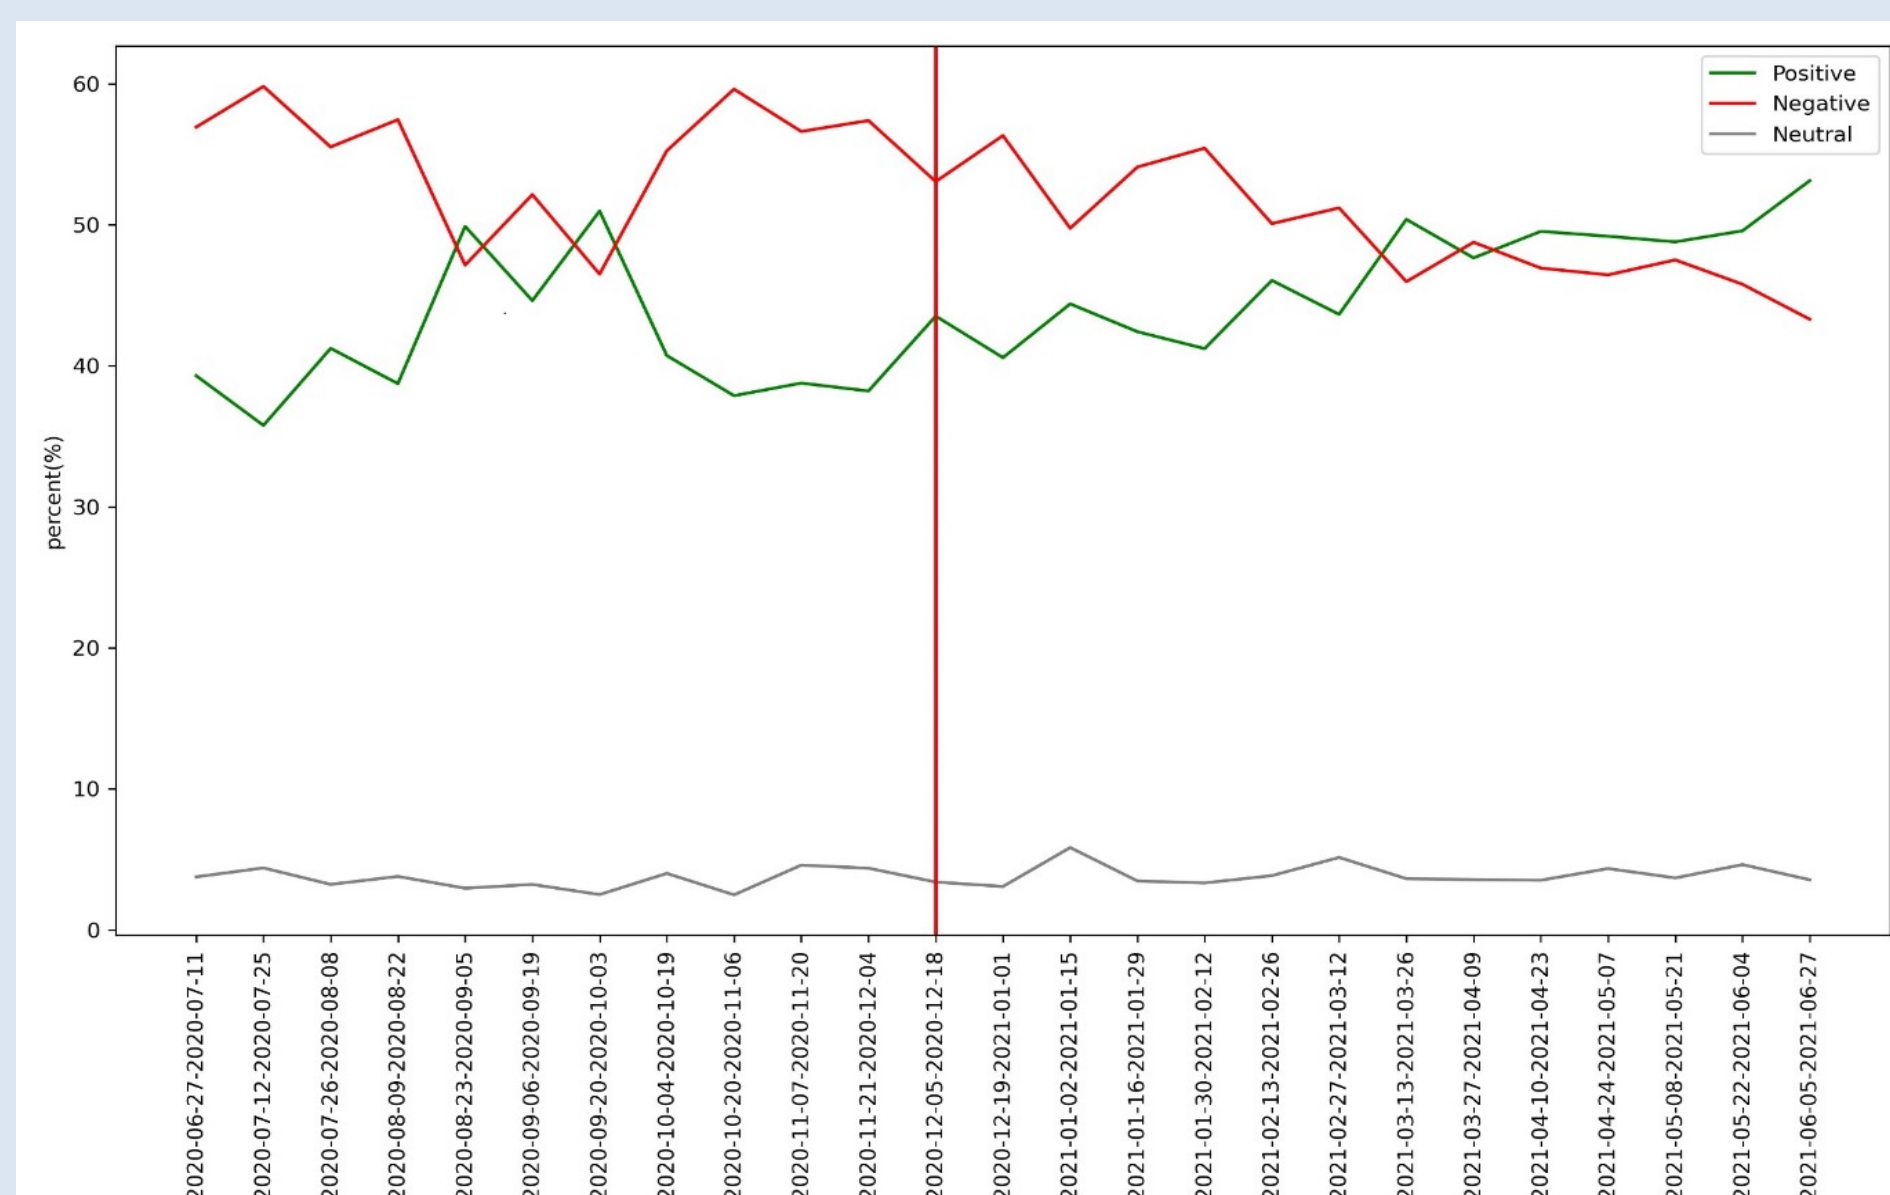

Preprocessing

- Lowercasing
- Lemmatization and Tokenization

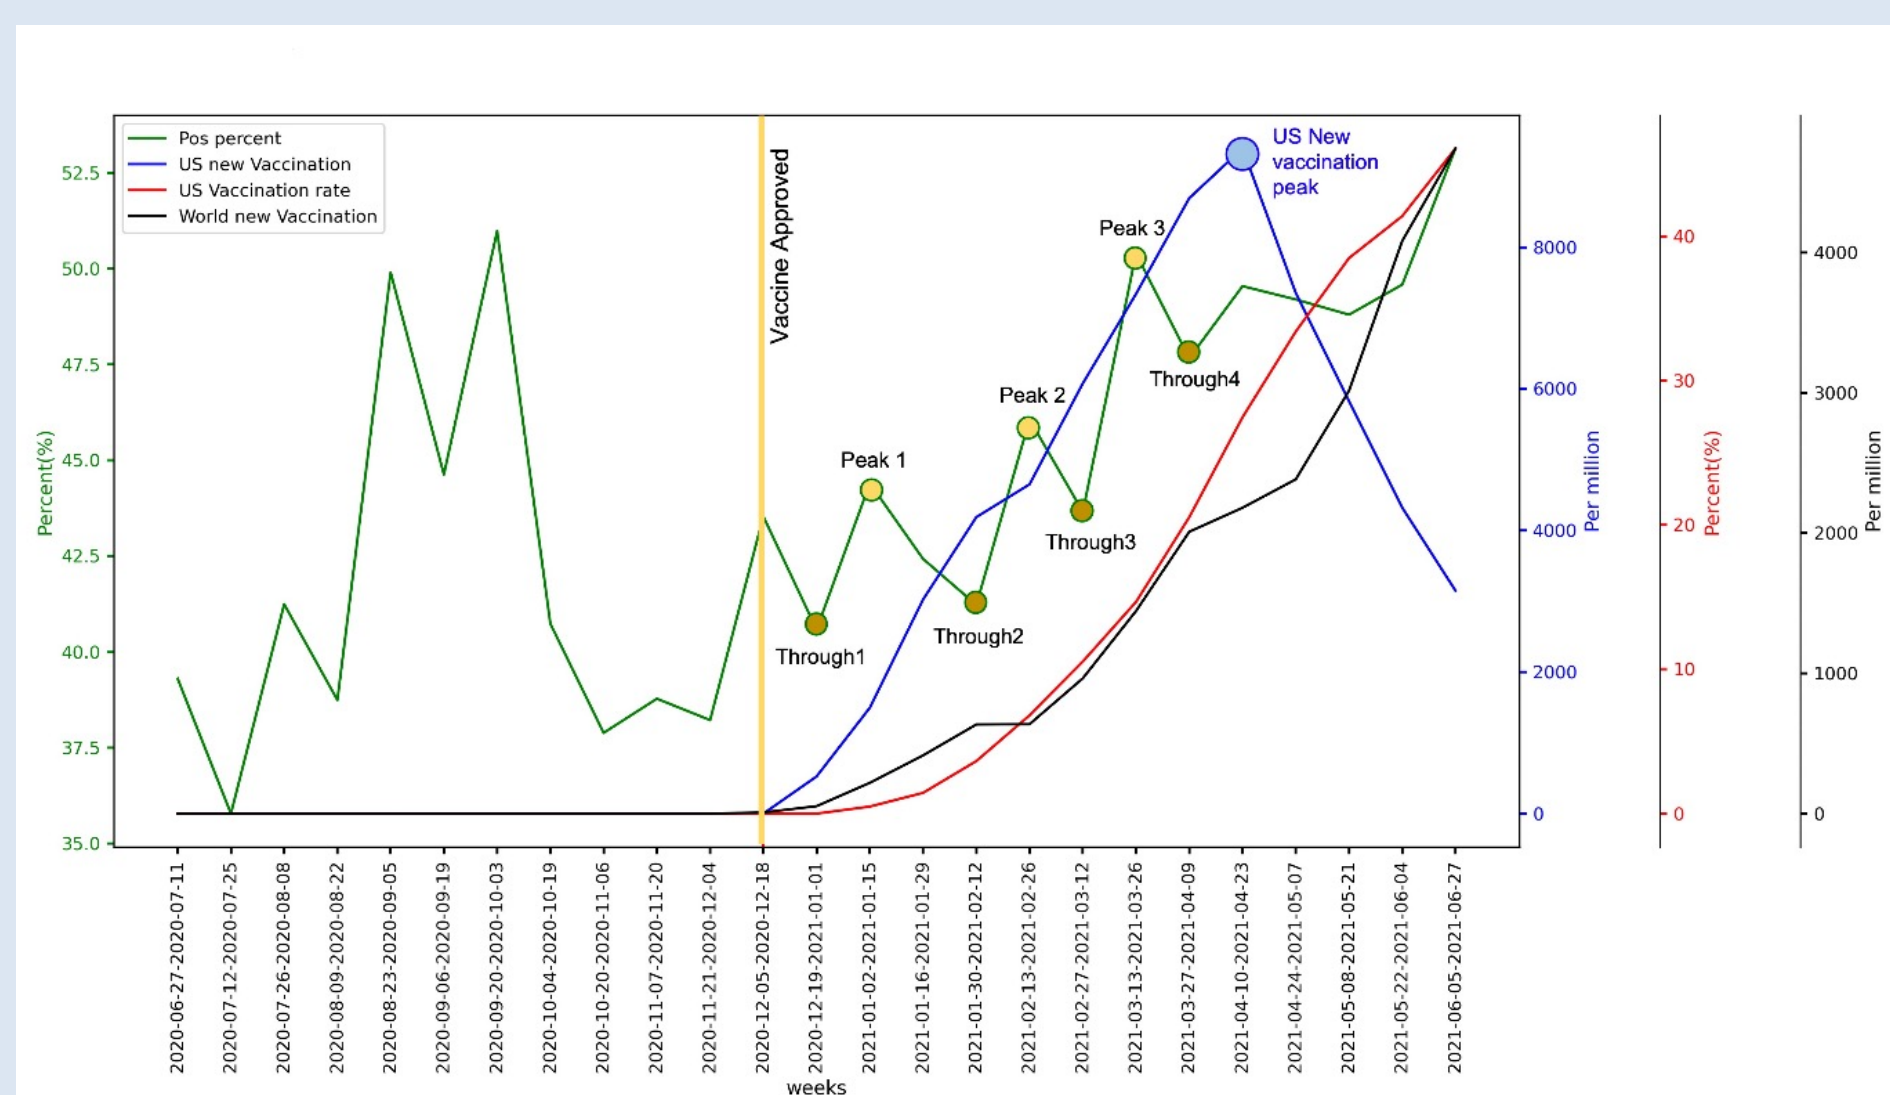

Analyzing

- Word2Vec
- Sentiment Analysis with BERT (Pre-training of Deep Bidirectional Transformers for Language Understanding)

Result / Discussion

Before Vaccine released, the proportions of positive and negative sentiment fluctuated
After Vaccine released, the overall negative sentiment over vaccine decreased and positive rates increased

Ceiling point of new COVID-19 vaccination occurred when **27.46% of the US population** had been vaccinated
Positive sentiment increased, the number of **new vaccination increased** until it reached the ceiling point

Representative comments

Positive Adjectives

Safe

...t is a safe vaccine. Anti-vaxxers are doing their best to overhype claims that it is not safe, but it has been used on over 200,000 people now without any significant negative effects...

Plan

... Vaccinated people can, however, begin to make plans for 2021 and look forward to resuming aspects of the old normal as more and more people get vaccinated ...

Able

.... Personally, I would encourage everyone to get the vaccine as soon as they’re able to, although it’s ultimately your decision...

Positive sentiment	Negative sentiment
safe	early
plan	variant
state	scientists
choice	booster
best	cost
deaths	mutations
new	second
able	type
Canada	information
majority	issue
force	research
nations	evidence
clear	Trump
USA	news
help	effectiveness

Negative Adjectives

Early

...The problem right now is that those people might not have gotten their second shot yet, or might have gotten infected right before being vaccinated. It’s too early to get any reliable data, give it half a year and we won’t even need data to know if they were effective...

Variant

...This is why despite of vaccinating 97 million people yet the vaccination is facing issues of shortages, lack of evidences against new variants for which bridge trials are going on and dearth of vaccine makers to join Covax a global vaccine alliance ...

Mutation

...Each individual infection is another opportunity for viral mutation and if the virus mutates to the point where the vaccines can no longer recognize it, then it could become a cat and mouse game between variants versus vaccine

boosters/modifications...

Vaccine semantic close words

Positive adjectives
(shown in peak points)

Negative adjectives
(shown in through points)

- Positive adjectives shown in positive peaks indicate that people desire ”before-covid” daily life through vaccination
- Negative adjectives shown in throughs imply that the main concern in vaccine hesitancy is lack of efficacy against variants
